EDENTA H1SEB ENDO CARBIDE BURS RAXL

The efficiently cutting bur blades enable pressureless, minimally invasive preparation. The long, slender neck guarantees good visibility to the access cavity. Endoburs with L34 are particularly suitable for preparing under a microscope to ensure an optimum view of deeper areas of the pulp chamber, and showing the anatomy of the cavity chamber floor. This facilitates minimally invasive opening of root canal orifices and exposure of obliterated canals.

EDENTA H1SNL ENDO CARBIDE BURS RAXL

Efficiently cutting special endodontic bur used for detecting all root canals in the case of multirooted teeth. The H1SNL has a particularly high cutting efficiency and its long neck ensures a clear view in deeper regions of the cavity for opening the access cavity of the root canal system. Use in a contra-angle with micromotor at 1,500 - 2,000 rpm, without cooling, dry and apply only light pressure during preparation.
